Prior to the first use of this Bluetooth audio receiver, it is recommended that you charge the receiver's lithium ion battery. This is accomplished by connecting the included USB cable's mini male plug to the receiver and then connecting the standard USB male plug into an open USB port on a computer or into the included power adapter.

A red LED indicates that the receiver is charging. The battery should be fully charged after about two hours. When the receiver's battery is fully charged, the red LED will turn off. The Bluetooth audio receive is able to operate while charging, but it is recommended not to use it while charging, leaving the power switch in the off (aft) position.

We recommend keeping the Bluetooth audio receiver in a dry environment and minimize its exposure to moisture. If the receiver does get wet, turn the power off immediately, and let the receiver sit overnight before reapplying power.

Turn the Bluetooth audio receiver on by moving the switch towards the USB and audio ports. Immediately, a blue LED and red LED will flash alternately indicating that the receiver is ready to pair with a transmitting device (such as a smartphone or tablet).

Pairing is quick and simple: turn on your connecting device's Bluetooth function, set your device to discoverable, turn the Bluetooth receiver on (initially indicated by alternating red and blue flashing LEDs), locate the SF-LY001 on your device and select it, finally enter a PIN of 0000.

Once paired and connected, the LEDs will change to a flashing blue LED. After the initial pairing, you will only need to select the SF-LY001 on your device to connect to it.

**Note:** The mini USB port is for charging only. Not designed for signal transfer over USB connection.
