General Description

ICEpower250ASP is a high quality audio power solution capable of generating 250W RMS output directly from selectable 115/230 volt mains.

The ICEpower250ASP integrates the conventional power supply and amplifier into one highly compact and lightweight solution with state-of-the-art performance.

Applications include:
- Active speakers and subwoofers
- Installation audio products
- High-end stereo and multi-channel amplifiers

For full range multi-way or multi-channel applications up to two additional ICEpower250A amplifiers may be powered from the DC-bus connector. The ±12 volt outputs of the ICEpower250ASP also provide general purpose auxiliary supplies for external circuitry.

The aluminum extrusion includes slots that accept 3mm thread forming screws for easy mounting to any chassis or back plate. The ICEpower250ASP is protected against short-circuits, overload and over-heating and the on-board fuse and EMI filtering provides a CE and FCC approved design.

Key Specifications
- 250W @ 0.01% THD+N, 1kHz, 2.7Ω
- 300W @ 1% THD+N, 1kHz, 2.7Ω
- 112dBA dynamic range
- THD+N < 0.08%, 0.1W – 170W, 4Ω
- Bandwidth limit = 80 kHz (8Ω)
- Total efficiency 83% @ 100W, 8Ω
- Stand-by power dissipation typically 2W
- Mains connection is class 1 (with earth)

Key Features
- Very rugged construction for professional use
- Comprehensive protection scheme
- Suitable for CE approved designs
- Power output for ICEpower250A
- ±12 volt auxiliary output
- Selectable mains 115/230Vac
- Safety conforms to: UL6500 and others
- EMI conforms to: EN55103-1, EN55103-2, FCC part 15b Class A
Block Diagram

Connection Diagram
The plug interface of the ICEpower250ASP modules has four industry standard connectors selected for long-term reliability.

**AC Connector Specification (P3)**
The ICEpower250ASP is Class 1 equipment and therefore must have an earth connection.

Table 15: Thermal specifications
Disturbances on the Mains

The signal on the mains connection is often very noisy and large surge voltages are present. The ICEpower250ASP is equipped with mains filtering to suppress surges and noise.

Lightning

To avoid damage of the ICEpower250ASP in case of surges caused by lightning, special care and component selection have resulted in capability of withstanding surges up to 8kV. (Tested with surge generator meeting IEC1000-4-5 at 8kV).

Mechanical Specifications

During development the ICEpower250ASP has been exposed to tough mechanical tests to ensure reliable performance in even the most demanding professional applications.

Typical Performance Characteristics

Frequency Response

![Frequency response graph](image)

Figure 4: Frequency response in 4Ω, 8Ω and open load. Top – amplitude. Bottom – phase.

Output Impedance

The output impedance is measured by feeding 1A_{RMS} into the output of the amplifier and measuring the voltage on the output. The output impedance then corresponds to the measured voltage.

The measurement is done at three different points to illustrate the impedance of connectors and wires. The curve showing the lowest impedance is measured directly on the PCB. The next curve is measured at the terminals of the ICEpower application connector. The curve showing the highest impedance is measured at one pair of the four banana plugs on the ICEpower application connector (10cm wire).

![Output Impedance graph](image)

Figure 5: Measured voltage at output terminals while feeding 1A_{RMS} into the output of the amplifier.
**Damping Factor**
The damping factor is calculated as the ratio between the output impedance and the load impedance. The three curves relate to the different curves of the output impedance.

---

![Damping Factor vs Frequency 8 Ohm](image1)

Figure 6: Damping factor vs. frequency 8Ω.

![Damping Factor vs Frequency 4 Ohm](image2)

Figure 7: Damping factor vs. frequency 4Ω.
S/N Ratio vs. Power Output
The signal to noise ratio depends on the chosen “signal” output power in relation to the idle noise floor. When the output signal level is equal to the maximum output power of the amplifier the S/N ratio is equal to the dynamic range of the module.

Figure 8: S/N vs. output power
Harmonic Distortion & Noise

THD+N vs. output power at 100Hz, 1kHz and 6.67kHz \( (Ω) \).

Idle noise (16K FFT). Residual = 80\(μ\)V(A).

THD+N vs. output power at 100Hz, 1kHz and 6.67kHz \( (Ω) \).

f = 5kHz. Po = 100mW. 4Ω loading. THD = 0.003%.

THD+N vs. output power at 100Hz, 1kHz and 6.67kHz \( (Ω) \).

f = 5kHz. Po = 1W. 4Ω loading. THD = 0.0045%.

Figure 9: Total harmonic distortion & noise.

4) An Audio Precision AES17 20 kHz 7th order measurement filter is used for measurements. The frequency 6.67 kHz corresponds to the worst-case situation where both 2nd and 3rd harmonics are within the audio band.
Intermodulation Distortion (CCIF, SMPTE & TIM)

CCIF IMD vs. $P_0$, $R_L = 4\Omega$, $f_1 = 14kHz$, $f_2 = 15kHz$.

TIM vs. output power. $R_L = 4\Omega$.

TIM FFT analysis. $R_L = 4\Omega$, $P_0 = 10W$, TIM $= 0.003\%$.

CCIF IMD analysis. $R_L = 4\Omega$, $P_0 = 10W$, IMD $= 0.0009\%$.

Figure 10: Intermodulation distortion
**Power Bandwidth**

Due to the compensating Zobel network in the output stage, the maximum allowable short-term output power is frequency-dependant. The short-term output power is defined as the maximum undistorted (THD+N < 0.1% ) output power until thermal shutdown occurs. Note that long-term high power levels may be limited by other safety circuits before the HF long-term power limit is reached.

![HF long-term power graph](image1)

**Figure 11: HF long-term output power**

Due to the HF protection circuit the amplifier is only able to deliver full output at high frequencies for a short time.

![Time vs Frequency at full output power graph](image2)

**Figure 12: Duration of full output vs. frequency**
Efficiency vs. Output Power

The total power conversion efficiency is calculated as the ratio between the audio output power and the power consumed from the mains.

Figure 13: Efficiency vs. output power (8Ω load, 1 kHz audio).

Figure 14: Efficiency vs. output power (4Ω load, 1 kHz audio).

Figure 15: Efficiency vs. output power (2.7Ω load, 1 kHz audio).
Loading

With its low output impedance, the ICEpower250ASP is designed to be unaffected by loudspeaker loading characteristics. However, care should be taken with purely capacitive loads.

Traditionally amplifiers have been tested extensively in laboratories with purely capacitive loads. This was done to test the amplifier’s stability and performance but it does not relate to any normal speaker load as even electrostatic speakers do not present a purely capacitive load to the amplifier but include a resistive part as well. The maximum purely capacitive load allowed is 470nF.

Features

The ICEpower250ASP has a number of useful features as described below.

Standby/Protect Control

The Standby/protect pin is pulled low internally when the protection circuits activates. It is also possible to pull the pin low externally to activate the low power consumption mode.

The recommended external circuit for shutdown is shown in Figure 16. The timing specifications are only valid with the interface circuit shown in Figure 16.

![Figure 16: Interface and simplified internal circuit for Shutdown/protect pin.](image-url)
**Monitor Output**

The monitor output has been implemented as an attenuated ground referenced (unbalanced) version of the balanced output signal. The internal output circuit of this output is shown below.

The monitor output is attenuated 1.3dB in relation to the input signal and the bandwidth is limited to 45 kHz.

**Soft clipping and Clipping Detection**

The ICEpower250ASP is equipped with a soft clipping circuit that shapes the input signal softly and limits the maximum signal level to the output stage. The soft clipping system eliminates saturation of the control system for optimum sound performance in high-level situations.

The Soft clip pin is an open collector output with a series resistor for connecting directly to an LED or external processing circuits. The internal circuit is shown in Figure 18.

**Soft-clip off**

The Soft clip off pin disables the internal soft clipping circuit when pulled low. This allows for use of external clipping circuits to suit the application without interference from the internal circuit.

Even with the Soft clip off pin set to low the protection features still activate the internal circuit.
Protection Features

The ICEpower250ASP is equipped with professional protection features for surviving in the rough professional audio environment without damage and without compromising the audio quality. Generally the protection circuits are designed with the philosophy of “audio all time” in mind and therefore all protection circuits are self-resetting. The only circuit that does not reset is the ‘HF on output’ circuit that only activates in case of a failure or large capacitive load.

Over current protection

The over current protection is designed with two states. The first state limits the output current to the protection level of 25A. This level of current is allowed for a short period of time, but if the output current remains too high, state two is activated. State two disables the amplifier for the same amount of time as if a power failure had occurred. The amplifier will restart when the cause of the overload has been removed, and in case of short overloads, the music will continue playing.

Thermal Protection

The ICEpower250ASP is equipped with two thermal protection circuits. The first monitors the temperature of the power supply and attenuates the output voltage if the temperature exceeds the limit. The other protection circuit monitors the amplifier temperature and shuts down the amplifier if the temperature becomes too high. Both protection circuits are self-resetting once the temperature has dropped to an acceptable level.

Overload Protection

In case of high-amplitude continuous low frequency signals in loads lower than 2.7Ω the power supply may not be able to deliver the required amount of power to the amplifier and the supply voltage will drop. The overload protection circuit will then lower the threshold of the input soft clipping circuit until the output power has been reduced to an acceptable level. As a result the amplifier will not shut down because of under voltage and the music will still be playing but with a softly shaped audio signal.

Long-term HF Protection

The output filter of the amplifier is not capable of handling large long-term high frequency signals due to the Zobel-network. This protection circuit decreases the threshold of the soft clipping circuit to limit the input signal in case of overload. Consequently, damage to the Zobel-network (or a high frequency driver) should not occur even under laboratory tests or any other condition that is not music (e.g. microphone feedback). The ICEpower250ASP has been tested at extreme levels with the most demanding music without triggering the high frequency protection circuit.
Input/Output Interfaces

Input Stage
The balanced input section on the ICEpower250ASP provides signal buffering and anti-aliasing filtering. The balanced configuration helps to avoid hum and noise pick-up in poorly shielded cables. An unbalanced input can be set (without affecting the overall gain) by applying a short between Vi- and AGND.

\[
\begin{array}{c}
\text{AGND} \\
\text{Vi-} \\
\text{Vi+} \\
\end{array}
\quad
\begin{array}{c}
1k \\

\text{3k9} \\
\end{array}
\quad
\begin{array}{c}
\text{3k3} \\
\text{C1} \\
\text{1k} \\
\end{array}
\]

Figure 20: Balanced input buffer.

The input impedance of the signal input section is approximately 8kΩ over the audio bandwidth, which is an acceptable loading condition for most pre-amps, active crossover outputs etc.

Output Stage
The output stage is a full bridge topology with a 2nd order filter meaning the power output on the terminals Vo+ and Vo- is balanced. The output filter design is a part of ICEpower’s proprietary MECC topology and has been chosen as a compromise between demodulation characteristics, efficiency and filter compactness.

\end{array}
\quad
\begin{array}{c}
\text{Vo+} \\
\text{Vo-} \\
\end{array}
\]

Figure 21: Output filter section with compensating Zobel network.

The essential output characteristics are:
- The switching residual on the output primarily consists of a single frequency component at the carrier fundamental \( f_c \).
- The system bandwidth is 60 kHz in 8Ω.

Warning! The balanced speaker outputs are both "hot" with a common-mode DC level equal to \( V_p/2 \). Balanced probes should always be used for monitoring and measurements.
**Operational Timing Diagram**

The mains voltage and standby/protect pin control the ICEpower250ASP. If the mains voltage is below its minimum value the module will enter standby mode. The amplifier can be forced into standby mode by pulling the standby/protect pin low.

![Operational Timing Diagram](image)

Figure 22: Supply start-up and shutdown timing definitions.

**Power-up Sequence**

The power supply controls power-up of the ICEpower250ASP. The power supply section has a delay (tacd) from the mains voltage reaches the minimum value to all output voltages are up. In order to ensure power supply stability before start-up, a controlled delay (tsd) has been introduced before the switching output stage is enabled with a 50% duty-cycle (zero modulation). Thus the total delay from power is applied to full signal amplification is tacd + tsd.

**Power-down Sequence**

The module will enter into standby mode if:

1. The mains voltage drops below ACmin or falls out completely.
2. The standby pin is pulled low.
3. Temperature protection is triggered
4. Over current protection is triggered

In all events the ICEpower250ASP will shut off instantly (tpsd = 200μs typical) by disabling the switching power stage. Following a power down event the ICEpower250ASP will follow the standard power-up sequence.
Thermal Design

Thermal design is generally a great challenge in power amplifier systems. Linear amplifier designs operating in class A or AB are normally very inefficient and therefore equipped with extensive heat sinking to keep the transistor junction temperature low. The ICEpower250ASP is based on highly efficient ICEpower switching technology providing high overall efficiency characteristics at all levels of operation.

Part of the “component” philosophy of the ASP-series is to provide a self-cooled component thus eliminating the need for special attention to thermal design.

The ICEpower250ASP is designed for music reproduction, which means that the output power of the amplifier will never be continuous. If the average power exceeds 90W @ 4Ω (typical) for a long time at 25°C ambient temperature, the module will reach its maximum allowable temperature and the temperature protection will be activated. At 50°C ambient temperature more than 35W @ 4Ω (typical) average power will activate the temperature protection.

For extreme loading requirements with a high continuous average loading or ambient temperatures above 40°C, we recommend the use of an external heat sink, which will improve the FTC power rating.

Further information is located in the ICEpower ASP Designer’s Manual.

Fuses

The ICEpower250ASP has been safety approved using the following fuses

**115V Mains:** T3.15AH 125V
Wickmann/Littlefuse series 181 or series 215

**230V Mains:** T2.5AH 250V
Wickmann/Littlefuse series 181 or series 215

T: time-lag H: high-breaking
5*20mm, according to IEC60127-2/5 and UL248.14

High-breaking capability (1500A) fuses are used for safety reasons and to allow powering up more than 30000 times. Fuses from different vendors are not guaranteed to be alike and in any case the module is only safety approved with the above-mentioned fuses.

The ICEpower250ASP is fitted with the fuse suitable for 230V use (and with the voltage selector set to 230V) on delivery as this is the safest setup for protecting the module for global use. To use the ICEpower250ASP in 100V/115V areas, please set the voltage selection jumper to 115V and change the fuse to the type listed above for 115V.
Physical Dimensions

All dimensions are in mm.

Important! A minimum clearance of 12 mm. above the module is required for safety and ventilation reasons.
Figure 24: Physical dimensions for mounting slots in mm
Figure 25: Physical dimensions for mounting slots in mm.
**Safety Standards**

The ICEpower250ASP has been pre-approved for safety by CSA to ease the design-in procedure and complies with the following standards:

US: UL6500 2nd ed.
The following chapters apply to the product: §7, 10, 11, 13, 14, 15 and 20

**Safety class**

Class 1 (with earth)

**ESD Warning**

Bang & Olufsen ICEpower products are manufactured according to the following ESD precautions:

Further handling of the products should comply with the same standards.

The general guarantee policy of Bang & Olufsen ICEpower a/s does not cover ESD damaged products due to improper handling.

**Packaging and Storing**

The ICEpower250ASP is delivered on pallets of 80 units. Each pallet has 5 x 2 cartons, each with 8 units.

**Dimensions and Weight**

<table>
<thead>
<tr>
<th></th>
<th>Dimensions (W x L x H) [cm]</th>
<th>Weight [kgs]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carton</td>
<td>57 x 35 x 18</td>
<td>9.8</td>
</tr>
<tr>
<td>Pallet</td>
<td>80 x 60 x 105</td>
<td>105</td>

</tbody>
</table>

ESD safe cardboard is used for wrapping.

**Storage Humidity**

Do not expose the pallets to rain or humidity levels higher than 85%.

**Storage Temperature**

The pallets are to be stored at temperatures from 0°C to 70°C.

**Stacking**

Pallets may not be stacked on top of each other.
